

Test Plan

For our test plan, we tested our source code end-to-end in a sandbox environment to make sure that in a production deployment, users would have a seamless experience. Given the scope of this project, we did not focus too heavily on testing as opposed to pure development. For future testing purposes, we envision a scalable A/B testing where different users could test out 2 versions of our software. Then, we would iterate based on feedback and continue the testing with a control/experimental group.

Regarding our testing, we did conduct some basic surveys and guided testing with friends. We asked them to pretend they were in an acute care facility and navigate both the wireframes (from the early sprints) and our app as we developed. We tested for navigation between pages, ability to access content, ability to get questions answered, and bugs in our code/app.
